Battery energy density is crucial because the higher the energy density, the longer the battery can emit a charge in relation to its size. That being said, high energy density batteries can be useful when there isn't much room for a battery but you need a lot of energy output. Smartphones and other handheld devices are great examples of this.

In simple terms the energy cell has thicker layers of active material, thinner current collectors and less of them. This means the energy cell will have a higher electrical internal resistance meaning it will generate more heat based on $I^2 R$ heating.. The energy cell will have poorer thermal conductivity in-plane and through-plane. Thus, it will need a higher ...
