Energy can also be stored by making fuels such as hydrogen, which can be burned when energy is most needed. Pumped hydroelectricity, the most common form of large-scale energy storage, uses excess energy to pump water uphill, then releases the water later to turn a turbine and make electricity.

Aside from using the weight of water to create this type of energy storage, there are also more common land-based methods, such as pumping the air into an evacuated salt mine. Flywheel . A flywheel is a mechanical battery that stores kinetic energy by powering a high mass rotor at high velocities with electricity. According to Dr. Marc Secanell ...
