As a promising offshore multi-energy complementary system, wave-wind-solar-compressed air energy storage (WW-S-CAES) can not only solve the shortcomings of traditional offshore wind power, but also play a vital role in the complementary of different renewable energy sources to promote energy sustainable development in coastal area.

However, the cost of offshore wave power generation is much higher than land electricity prices [6], so there is an urgent need for energy storage plans which can provide stable and probably cheaper energy supply. The actual round-trip efficiency (RTE) of CAES is generally between 40 % and 70 % [7], the earliest used Huntorf and McIntosh have ...

Adding wave power is a natural step because it creates more stability. For industry experts, this fact alone is not a revelation, as the balancing act performed by wind and wave has garnered interest and study for at least a decade. However, due to the lack of a viable wave energy technology, it has merely been theory up to this point.
