As of recently, there is not much research done on how to configure energy storage capacity and control wind power and energy storage to help with frequency regulation. Energy storage, like wind turbines, has the potential to regulate system frequency via extra differential droop control.

Reduces fossil fuel dependence: wind power reduces the need for fossil fuel-based power generation, promoting energy security and reducing greenhouse gas emissions. 4. Noise and aesthetic concerns: noise generated by turbines and their visual impact can lead to community opposition, affecting the placement and operation of wind farms.

According to the latest update, global investment in the development and utilization of renewable sources of power was 244 b US\$ in 2012 compared to 279 b US\$ in 2011, Weblink1 [3]. Fig. 1 shows the trend of installed capacities of renewable energy for global and top six countries. At the end of 2012, the global installed renewable power capacity reached 480 ...

In recent years, due to the global energy crisis, increasingly more countries have recognized the importance of developing clean energy. Offshore wind energy, as a basic form of clean energy, has become one of the current research priorities. In the future, offshore wind farms will be developed in deep and distant sea areas. In these areas, there is a new trend of floating ...
