Power from the public grid drives the synchronous alternator, which acts as an electric motor in this operating mode. This in turn drives the flywheel in the kinetic energy storage unit which weighs tons and is designed as an electric machine with double rotor system.

The electricity grid is the largest machine humanity has ever made. It operates on a supply-side model - the grid operates on a supply/demand model that attempts to balance supply with end load to maintain stability. When there isn't enough, the frequency and/or voltage drops or the supply browns or blacks out. These are bad moments that the grid works hard to ...
