Lithium-ion battery (LIB) is considered to be one of the most important energy storage and conversion technologies with prominent advantages of high energy and power densities, which have witnessed large-scale application in portable electronic devices, communication facilities, stationary energy storage, and ever-enlarging markets of electrically powered vehicles.

Abandoned mine sites in the United States can create environmental disturbances that last decades or longer. This talk proposes an idea that not only permanently rehabilitates such sites, but re-purposes them to create a renewable energy power plant large enough to allow entire cities to rely 100 percent on intermittent renewable energy sources like wind or solar power.

The reversibility and cycling stability of aqueous zinc-ion batteries (AZIBs) are largely limited by serious parasitic reactions and uncontrolled dendrites growth. Herein, *caulis polygoni multiflori* extract (CPM) has been proposed as electrolyte additive to build a convenient bridge to clear the way for Zn^{2+} to migrate to the zinc plate. CPM can set up "oxygen bridges" between Zn plate ...

Building block effect induces horizontally oriented bottom Zn(002) deposition for a highly stable zinc anode

High-temperature sodium-sulfur batteries operating at 300-350 °C have been commercially applied for large-scale energy storage and conversion. However, the safety ...

Xuefeng Zou: Funding acquisition. ... Aqueous zinc metal batteries (ZMBs) are considered one of the most promising large-scale energy storage devices due to their intrinsic safety, economy and environmental friendliness. Binder serves as a fundamental component in electrodes, playing a pivotal role in cyclic stability of ZMBs. ...

A flower-like vanadium sulfide/reduced graphene oxide (VS₄/rGO) composite was prepared by a typical hydrothermal method and it was investigated as cathode for aluminum-ion batteries with non-inflammable and non-explosive ionic-liquid electrolytes. The charge/discharge performance measurements were performed in a voltage range of 0.1-2.0 V versus Al/AlCl₄⁻, which gave ...

The controversies on the metallic lithium storage in the carbon nano-pores have never stopped for more than three decades since Sato speculated the formation of Li₂ molecules in the porous carbon to explain its high lithium storage capacity. Herein, we successfully realized lithium metal storage in the cavities of the carbon nanotubes (CNTs) and directly observed the ...

Lithium metal has been considered an ideal anode for high-energy rechargeable Li batteries, although its nucleation and growth process remains mysterious, especially at the nanoscale.

Phase change fibres (PCFs) with excellent thermal energy storage abilities and suitable tuneable temperature properties are of high interest for not only providing human comfort but also reducing energy waste. However, the complex fabrication process and the fragility and low durability of PCFs are issues that must be addressed to widen the scope of their application.

The high recoverable energy storage density of 10.2 J/cm³ is obtained at 560 kV/cm with an ultra-high efficiency of 93.0% in (Pb_{0.875}Sr_{0.05}La_{0.05})(Hf_{0.95}Ti_{0.05})O₃ ceramics. ... Poly(vinylidene fluoride) (PVDF) is the most popular electrode binder in the current lithium ion batteries (LIBs). Depending on solvent content, polymer electrolytes are classified into solid polymer electrolyte (SPE; solvent-free) and gel polymer electrolytes (GPE; solvent-rich). PVDF-based electrolytes with high contents of solvent undisputedly belong to GPE.

It is now universally accepted that the combustion of oil fuel is the major reason for modern cities' atmospheric contamination. 1,2 And, the decreasing amount of petroleum resources impels people to seek for other clean energy substitutes. Along with the development of renewable energy technology, such as solar, wind, and tidal energy, how to effectively store these kinds of ...

Abstract Recently, the (Pb,La)(Zr,Ti)O₃ antiferroelectric materials with slim-and-slanted double hysteresis loops have been widely drawn in the application of advanced pulsed power capacitors due to its low strain characteristic. In this work, the energy storage properties of (Pb_{0.895}La_{0.07})(Zr_xTi_{1-x})O₃ ceramics with different Zr contents are researched thoroughly ...
